

# Time domain geoacoustic inversion using back-propagation on SWAMI32 line array

Cheolsoo Park\*, Peter Gerstoft, Woojae Seong and William S. Hodgkiss

Marine Physical Lab. / SIO

# Outline

- ◆ Background of the work
- ◆ Experiment(SW06)
- ◆ Arrival amplitude fluctuation analysis (frequency, variation)
- ◆ Arrival amplitude variation (simulation)
- ◆ Inversion approach
- ◆ Inversion results
- ◆ Summary

# Background of the work

- Severe signal fluctuations were observed !
- (Q1) What is the physics in the fluctuations ?
- (Q2) Does inversion work for the time-varying data ?

# Experiment (SW06)

## SWAMI 32 circle track

## Sound Speed Profile

## Wave Spectra

- ◆ New Jersey continental shelf break
- ◆ Source circle track ( $R_{\text{circle}}=190\text{m}$ ,  $SD=35\text{m}$ )
- ◆ Strong thermocline in SSP
- ◆ Ocean Wave Peak freq. = 0.12 Hz    $H_{1/3} = 2.2 \text{ m}$

# Arrival amplitude frequency analysis

## Direct Arrivals (ch.3)

- Amplitude fluctuations with dominant frequency 0.12Hz (8.3s)
- Cf. Surface wave freq. = 0.12 Hz

## Surface Reflected Arrivals (ch.3)

- Almost random fluctuation
- Weak dominant frequency variation ( 0.1~0.25 Hz )

# Arrival amplitude variations

## Amplitude Variations w.r.t Channel

- Largest direct arrival fluctuation at channels 4-7 below strong thermocline
- Large surface R arrival fluctuation at all channels with similar amounts of variation
- Stable bottom R arrival

# Arrival fluctuation due to ocean waves

## (Q1) What is the physics in the fluctuations ?

- ◆ (1) Measured ocean wave frequency : 0.12 Hz,  $H^{1/3}$  : 2.2 m
- ◆ (2) Significant source depth oscillation riding ocean waves ( $\pm 1.1$ m)
- ◆ (3) Small thermocline oscillation by water particle circulation ( $R= 0.2$ m @ 25m )

(1) Wave Spectra

(2) Source movement riding waves

(3) Water particle trajectory

# Arrival fluctuation due to thermocline

(Q1) What is the physics in the fluctuations ?

- Downward refracting rays due to thermocline
- Direct arrival interference causing amplitude variation (Y.-M. Jiang and N. R. Chapman, JASA EL, 2008)

# Direct arrival amplitude variation : simulation

## Direct Amplitude Variations Simulation

- Up-down source oscillation  
depth :  $35 \pm 1$  m @ 0.12 Hz
- Water column SSP fixed (CTD 44)
- Variations reproduced

(Q1) What is the physics in the fluctuations ?

**Source oscillation + Thermocline  $\Rightarrow$  Direct Arrival fluctuation**

# Inversion Approach

## 💧 Inversion Model

## 💧 Multi-step optimization

- (1) Preliminary SD & VLA tilt using all channels
- (2) SSP in thermocline zone using ch. 3 ~ 7
- (3) SD, VLA tilt, and remaining SSP using all channels
- (4) Bottom parameters (sound speed, density)

# Inversion Results (1)

(Q2) Does inversion work for the time varying data ?

- Source depth oscillation clearly detected
- Source depth variation frequency (0.123Hz) exactly agrees with ocean wave freq.(0.12Hz)
- Variations amplitude (0.9m) agrees with ocean wave amp.(1.1m)

**Source Depth Spectrum**

# Inversion Results (2)

# Summary

- ◆ Severe signal fluctuations were observed in SWAMI32 acoustic data.
- ◆ Ocean surface wave + thermocline can explain the direct arrival fluctuation.
- ◆ Geoacoustic inversion using back-propagation with direct and bottom reflections works successfully.
